

TITAN GRID

Industrial Platform for Transformer Components and Energy Infrastructure

PROJECT BRIEF

Prepared for Her Excellency, the Ambassador of the Republic of Türkiye to Montenegro

Project sponsor and Montenegro-side project holder

ARS Metal Industries d.o.o., Montenegro

Industrial focus

Transformer tanks, corrugated wall / fin-wall systems and related fabricated steel components for the power-transformer industry.

Strategic orientation

A Montenegro-based industrial platform designed to serve the European and Western Balkan energy-equipment supply chain while deepening industrial cooperation with Türkiye.

TITAN GRID is conceived as a bridge between Montenegro's industrial development ambitions, Türkiye's manufacturing know-how and supplier base, and Europe's growing need for resilient energy-infrastructure supply chains.

September 2026

1. Project Overview

TITAN GRID is an industrial-development platform centered on establishing specialized manufacturing capacity in Montenegro for components used in electrical power transformers. The core production scope includes transformer tanks and corrugated wall / fin-wall systems, supported by steel cutting, forming, welding, assembly and quality-control processes.

ARS Metal Industries d.o.o. is the Montenegro-side project holder. The company's development vision is to build a regional supplier of transformer components integrated into the European energy-equipment supply chain. Existing project materials identify Tuzi, Montenegro as the industrial location and describe a planned steel-processing capacity of approximately 9,000 tonnes per year.

2. Why the Project Matters

Industrial development	Creates specialized manufacturing capability in Montenegro for a strategically important energy-infrastructure value chain.
Supply-chain resilience	Supports diversification and regionalization of transformer-component supply for European and Western Balkan markets.
Türkiye-Montenegro cooperation	Provides a practical platform for combining Turkish industrial know-how, equipment and supplier relationships with a Montenegro-based production and investment framework.
Energy transition	Addresses components required by transformer manufacturers and grid projects as electricity networks are expanded, modernized and reinforced.

3. Strategic Türkiye Dimension

Türkiye is a natural strategic counterpart for TITAN GRID because of its established metal-processing base, transformer-industry ecosystem, machinery suppliers and geographic proximity to Montenegro and European markets. Project documentation also identifies Turkish industrial cooperation and steel sourcing as important elements of the supply-chain concept.

The objective is not limited to procurement. The project is intended to create a durable framework for industrial know-how transfer, supplier development, production-side alignment and investment cooperation between companies and institutions in Montenegro and Türkiye.

4. Strategic Pillars

01 Industrial Manufacturing	Develop competitive Montenegro-based production of transformer tanks, corrugated walls / fin-wall systems and related fabricated steel components.
02 Energy Infrastructure	Position the project within the expanding European and Western Balkan transformer and electricity-grid value chain.
03 Türkiye-Montenegro Industrial Partnership	Build structured cooperation around know-how, machinery, steel supply, engineering, production methods and industrial execution.
04 European Supply-Chain Integration	Develop a regional supplier capable of serving transformer manufacturers and grid-related projects across European markets.
05 Investment and Project Finance	Maintain a bankable project framework supported by disciplined CAPEX governance, lender-grade documentation, auditability and transparent approval controls.
06 Technology and Quality	Implement modern steel-processing, welding, fabrication and quality-control practices aligned with the requirements of the transformer industry.
07 Sustainable Industrial Development	Support efficient production, responsible resource use and an industrial platform compatible with the long-term modernization of energy infrastructure.
08 Human Capital and Skills	Create specialized industrial capabilities and strengthen local technical, engineering and production skills through cooperation with experienced partners.

5. Proposed Institutional Dialogue

ARS Metal Industries would welcome an opportunity to present TITAN GRID to the Embassy of the Republic of Türkiye and to explore appropriate channels for connecting the project with relevant Turkish industrial companies, technology providers, financial institutions and investment-support organizations.

The immediate objective is to establish a constructive institutional dialogue and identify areas where Türkiye-Montenegro cooperation can accelerate the development of a competitive regional manufacturing platform for the energy sector.
